Computer Vision

CRL's Computer Vision Group (CVG) conducts cutting-edge research in 3D computer vision and machine learning with the aim to improve the ability of software to understand and interpret visual data. In our work we support Toshiba's overall mission to create modern technology with a positive impact on society. Our main focus is on fundamental and academically oriented research, and consequently we also have ongoing collaborations with top UK universities.

RESEARCH

Online Structure from Motion

The problem of online structure from motion is also known as simultaneous localisation and mapping. It involves a system that estimates a sensor's pose and the structure of the environment in real-time. We develop methods for visual odometry, loop closure detection and pose graph optimization.

[Scale Exploiting Minimal Solvers for Relative Pose with Calibrated Cameras, S. Liwicki et al., BMVC \(2017\)](#)

[Online Variational Bayesian Motion Averaging, G. Bourmaud, ECCV \(2016\)](#)

[The Likelihood-Ratio Test and Efficient Robust Estimation, A. Cohen et al., ICCV \(2015\)](#)

Pose Graph Optimization

Visual Text-to-Speech

In collaboration with CRL's Speech Technology Group we produced a complete system for expressive visual text-to-speech. Our system is able to producing expressive verbal and visual output in the form of a 'talking head', given an input text and a set of continuous expression weights.

[Expressive Visual Text-to-Speech as an Assistive Technology for Individuals with Autism Spectrum Conditions, S. A. Cassidy et al., CVIU \(2016\) / free](#)

[Photo-Realistic Expressive Text to Talking Head Synthesis, V. Wan et al., Interspeech \(2013\) / free](#)

Optimization Methods

Energy-minimization methods are ubiquitous in computer vision and related fields. In our work we design efficient low-level optimization strategies at pixel level, and robust optimization methods for 3D vision problems with high complexity.
